Project Summary

Project Title: AI-Integrated School Management Software

Our proposed project is a School Management Software that will help an educational institution manage its academic, administrative, financial, and communication activities in one place. The main goal of the system is to reduce manual work and make everyday school management easier for administrators, teachers, accountants, students, and parents.

The system will contain different modules based on the needs of the institution. These will include student management, teacher and staff management, student and general accounts, attendance management, examination and result management, class and exam routines, payslip management, holiday management, online admission, user management, website management, SMS management, and institute settings. The system will also allow the institution to generate and print documents such as student ID cards, certificates, and admit cards. Different users will have different levels of access according to their roles.

An important part of our project is the **AI integration**. Instead of adding AI only for demonstration purposes, we want to use it in features that can actually help the institution. For example, the system can analyze a student's attendance and academic performance and identify students who may need extra attention. It can also detect unusual attendance patterns and generate short summaries of a student's academic progress. An AI-based chatbot will allow students and parents to ask questions about fees, attendance, routines, and results in natural language. AI can also help administrators prepare SMS or notification messages and identify possible conflicts while preparing class and examination routines.

The software will have a responsive and user-friendly interface so that it can be accessed from computers and mobile devices. Other features will include SMS gateway integration, PDF and Excel export, and audit logs for important academic and financial activities. The system will also be designed in a modular way so that additional features or branches can be added in the future.

We will follow the **Agile development approach** throughout the project. In the first phase, we will work on authentication, user roles, student and teacher management, attendance, and the main dashboard. The second phase will focus on accounts, examinations, results, routines, SMS, and the initial AI features. In the final phase, we will complete the remaining modules, improve the AI features, perform testing, fix issues, and prepare the system for deployment.

Overall, our aim is to develop a practical and intelligent school management system that can reduce paperwork, make information easier to access, and help the institution make better decisions using its available data.
